

EUDEMOS CONTEST

The European Union is an economic and political association made up of 27 European countries that have delegated part of their sovereignty to common institutions to democratically make decisions on matters of common interest. The European Union favours a common good, so we must put all our trust in these 27 members to decide wisely and with understanding to the circumstances that the world is living today. One of these problems, is the AI (Artificial Intelligence) and the technological advances and improvements in our actual world.

Firstly, the advances of technology in the world sometimes seem effective and beneficial to our community, that is why they were created, but there are many reasons to stop these advances. The most dangerous is the Artificial Intelligence.

AI or Artificial Intelligence refers to the ability of a machine or computer system to perform tasks that normally require human intelligence. These tasks include speech recognition, decision making, problem solving, learning and understanding natural language. AI uses algorithms and mathematical models to process large amounts of data, learn from it and make predictions or decisions based on that information.

Artificial intelligence at first seems exceptionally good and beneficial, but overall, in a few years, it will affect our society and the consequences may be catastrophic. One of these reasons is that with AI you do not have to think about nothing anymore, because is like a human with a wide range of information that is processed instantly. This would cause the brain to atrophy and our reasoning capacity would diminish more and more.

Another reason is that AI has no limits and every type of person has access to it. That is why they have been creating images of unclothed people without any kind of consent or authorization from that entity, also this could be very detrimental to our work and daily life as our lives depend on trust and if we can create fake images and videos our trust would not be full and our safety and that of our children would be affected.

This successful and extremely beneficial tool, for some people, may be the end of their college career or professional employment. AI may, in several years, leave many people unemployed who may be replaceable with this device.

This would be a disadvantage for the market because Artificial Intelligence has no limits and does not have to rest like a human being. Large companies would make that investment only once, because even if they need maintenance, you do not have to pay monthly, because they do not need it.

Also, this device is in process, and computer engineers are on their way to having a perfect tool for the market. Being in process means that it can be buggy. That is why we should not worry because the consequences will not be good.

In general, things are good up to a certain point, this means that everything must have limits. Artificial Intelligence and all technology must have an official law that limits people to use it incorrectly. Furthermore, this law must ensure that AI will never replace a human being or take away their job because they are worthy of having a job opportunity. This is what human rights laws dictate.

Furthermore, the limits should not only be on information and employment, but also on age. There are children who already from a young age have access to the Internet through their own device. This must change as the brains of these innocent infants may be affected or even atrophy and not be able to become as developed as the brains of their ancestors. This is a disadvantage for humanity, as they are the generation that in a few years will sustain the world, and if we do not give them the opportunity to grow up properly; it could affect the society.

In my opinion, a solution of this problem is that the access to it should be limited, and only authorized personnel should have access to it. These personnel should have a set of skills and should only be able to use it for the common good.

The other people who do not have access have many other alternatives to particularly useful servers and search engines, such as *Google*, *Microsoft Edge*, *Firefox*, *Opera*... Now there is not a problem to find a way to search information.

In conclusion, the advances in technology and the Artificial Intelligence are affecting in our lives. These factors should have limits and restrictions for all the people.
